Accident Report 43-12-10-501

B-26B Marauder 41-17862 440th Bomb Squadron 319th Bomb Group December 10, 1942

Lt. Grover C. Hodge, Jr., 0-789226, Pilot
 Lt. Paul W. Janssen, 0-727881, Co-Pilot
 Lt. Emanuel J. Josephson, 0-727019, Navigator
 Cpl. Frank J. Galm, 12037633, Radio Operator
 Sgt. Russell Weyrauch, 16042586, Flight Engineer
 Cpl. James J. Mangini, Jr., 12077708, Gunner
 Sgt. Charles F. Nolan, 32174825, Passenger

leader of a flyth of B-26's. The flight had to fly at about 11,000 ft. Le due la Claude . Two wing men were lost from De Hodge's sight v de product them to return to their have. The tast seed of It. 13, on ft. weeling in a clear area. It is believed It. Hodge encauntered weather or mechanical difficulties high his status of

HEADQUARTERS, NORTH ATLANTIC WING AIR TRANSPORT COMMAND PRESQUE ISLE, MAINE

TLB/EPE/jfr December 26, 1942

SUBJECT: Transmittal of A.A.F. Form No. 14.

Commanding General, Army Air Forces, War Department, Washington, D. C.

1. Transmitted herewith W.D., A.A.F. Form No. 14, on the follow-

B-26 B 41-17833 41-17760 B-26 B-26 41-17862

in accordance with A.A.F. Regulation No. 62-14, W.D., Headquarters, Army Air Forces, Washington, D. C.

2. Transmitted also is A.A.F. Form No. 14 on an RAF Boston which was submitted to this headquarters by the Control Officer at BW-1.

> T. L. BOYD. Lt. Col., Air Corps G-3.

4 Incls.

Incl 1 - Form 14 on B-26, 41-17833 Incl 2 - Form 14 on B-26, 41-17760

Incl 3 - Form 14 on B-26, 41-17862 Incl 4 - Form 14 on Boston, RAF

DESCRIPTION OF ACCIDENT

(Brief narrative of accident. Include statement of responsibility and recommendations for action to prevent repetition)

On 12-10-42 Quote and Goose giving, and forecasting to remain, favorable weather with weather forecasted as good it was decided to clear 3-25's to Goose. Tops were forecasted to be about 13,000 feet and the pilets were cautioned against instrument flying.

Lt. Hodge's flight departed Case at 1257 G.N.T. and formed west of Sam-

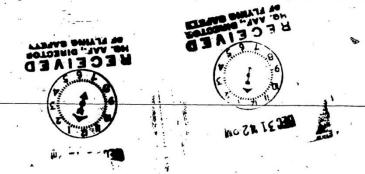

About 250 miles west of the Greenland Ceast the flight encountered thin thigh clouds. It. Hodge led his flight into openings and breaks at 8,000 feet and started climbing. As the clouds thickened bt. Redge ordered a 180 degree turn but lest two of his ving men in the clouds. It. Redge then ordered the two ships to return. It. Peppin, right ving men, raticed beat that he was in the clear at 11,500 feet and was told to preced to Goose. Another ving men, It. Seamon, was heiging radio trouble and at me time heard It. Hodge; he topped everything at 13,000 feet and proceeded to Goose. The third wing men, It. Floyd, followed It. Hodge.

Lt. Hodge, followed by Lt. Floyd, circled in a clear area at 13,000 feet, Lt. Floyd was circling with fresen controls when he saw the lead ship head in the general direction of Goose. This was the last seen of Lt. Hodge.

Unable to follow, Lt. Floyd, when his controls freed, returned to Omotos

It is believed Lt. Hedge encountered weather or mechanical difficulties beyond his status of training and the perfermence of his aircraft and this was directly responsible for the loss of his aircraft.

See attached reports made by other pilots cleared west that morning and the route forecast folder turned in by an R.A.F.F.C. eastbound pilot.

DESCRIPTION OF ACCIDENT

(Brief narrative of accident. Include can ment of responsibility and recommendations for action to prevent repetition)

From the notes left by the pilot, the following is presumed to have happened:

After departing from BW-1, the pilot was forced to go on instruments. After some time he turned to the Southwest till he found a break in the clouds and descended through in order to fly CFR. Navigator gave a correction to get back on the course, but evidently the correction was too large. The pilot tuned in on the Goose Bay range approximately half way between BW-1 and Goose Bay and after receiving the signal for a short space of time, the set evidently went dead.

The pilot attempted to use the radio compass and the liaison set, but failed to receive any signal from the Goose Bay range.

The flight continued on the corrected course given by the Navigator till the East coast of Labrador was reached. At that point the Pilot decided they were South of the course and headed North along the coast line. After some time the Pilot realized they were North of the course and nearly out of fuel, so he turned around and headed South, at the same time looking for a place to land.

They found a spot that looked fairly good for a crash landing so went in with the wheels up. The bomb bay was ripped open and one prop tip went thru the fuselage just in back of the pilot. Evidently there were no injuries to any of the orew members.

The aircraft made a crash landing approximately 20 miles North of Hebron, Labrador, although at that time the crew did not know the approximate position.

Three of the crew members, after a few days, struck out for Goose Bay and were never heard of. The four remaining crow members evidently died of exposure and exhaustion.

RECOMMENDATIONS: None.

(Supplemental Report)

IPO 1058, o/o Postmaster, New York, New York. Flight Report 3-26-3 117746 December 10, 1942. Took off from BY-1 at 1230. Left Simutak 1340 flying at \$500 ft. flight of three airplanes. Sky was clear. Macountered a scattered layer that became broken about 1000 ft. below. Commins whends were encounted and our altitule was increased to 8000 ft. in order to go between the clouds.

The level of the lever clouds increased and we topped all of them at 8000 ft. We ma into a condition where there were no breaks should be we let down to 1000 feet and tried to go under. There were showers to the surface of the vater with me breaks. We climbed back up three the scattered and broke ers. We climbed to 14,500 and flow into the top of some clouds. We called the other ships in the flight telling them that we were going to turn back. About this time we broke into the clear and informed the flight that we were on top in the clear at 14, 800 and heading on ownres again. Heither message was ne-knowledged by the flight (VEF). We were about 200 ft above broken clouds. As we continued on course the alouds levered until at the court, they were senttered at 2500 ft. We flow exatast from seast to desse.

Harigater took a sun shot when we broke into the clear at 14,500 and calculated our position to be 56° 50° N, 54° 03° W. Flight separated at this point. A TRUE COPY: Signed: Adolph B. Zismer Captain, A.C. ROBERT N. ONIFFIN. Captain, Air Corps, Centrel Officer.

I was flying on Lt Hedges left wing when we encountered thin high elouds. This was appreximately 1445 GMT and about 200 to 250 miles from the ceast of Greenland. We entered the clouds at about 7000 ft and began to pick our way through the eyenings and the thinest portions of the clouds and at the same time gaining altitude. The eleuis were very thin and Lt Hedge was in right most of the time. I picked up a little wing ice in these clouds.

The last time I see it Hodge was a couple nightee before I broke out of this cloud bank. We were at tex thousand it, and it Hodge made a slight turn to the left and crossed over the top of us. I broke out of the bank and was ever the top of the evereant at 12000. It hodge did not come out of the clouds so I continued to fooce Bay. There were two other planes in our formation when we started picking our way through the clouds. I lost the other two planes the same time I est sight of it Hodge.

At no time did I hear Lt Hedge on the radio although at the time I was having trouble with my radio.

The evercast was solid until we reached the coast after that there were seattered clouds. The top was 18000 ligariting to 9000 at the coast.

Boomber 10, 1942. Goose Bay, Labrader.

U.S. Air Gerps ship \$413063 pileted by myself departed from BW-1 at 1300 G.H.T. on December 10, 1842.-destination Goose Bay Labrador.

The flight was uneventful. Our flight of two B-250 aircraft was delayed about 20 minutes in the vicinity of Simintak Island (2M-2), We left the coast of Greenland at 13:45 S.M.T.The weather was generally clear visibility 20 miles around coastline. Recommerced sh overcast about 50 miles off coast running from about 1000 feet in layers up to apprex. 8 or 10 thousand. Further on course we had to accom/to 14-15 -16 thousand feet and alter our course several times to avoid the higher peaks of levering cumulus. We encountered no icing conditions arothing clouds of all types.

The entire flight ever the strait was made ever the top with only occasional glimpses of the water through holes in the everence.

The clouds became scattered about 30 miles off coast of Labrador and we flow into Goose May contact at seven thousand.

Our flight was of 4 hrs. 50 minutes duration. We landed at Goose Bay 17:50 G.H.T.

LT. A.C. PEPPIN - pilot B-26 Turtle U-117749(Ship HO.)

APO 6658, e/o Postmaster, Nov York, New York.

Documber 10, 1942.

I was the lead ship of two-B-26's, leaving B.V.3 at approximately 15:45 C.M.T.

Our altitude curoute for the first hour of flight was at 9000 feet. At this time we encountered high, heavy, bad weather clouds. We immediately ditered our course to the south, where it appeared to be lower. After five or ten minutes of flight we found an opening to the north-east. Sig-sagging our course and gradually attaining an altitude of 15000 feet, we finally topped the clouds.

We executered no icing conditions and visibility was generally good. Our two ships were in sight of one another at all times.

A TRUE COPT:

SIGHED: John G. Person,

Contain, Air Corps, Central Officer.

APO 6658, e/o Postmaster Nov York, New York,

Becember 11, 1942.

This is to certify that I, Lt. Rebert L. Fleyt, 0-651788 AG, took off from BV-1 on the merning of December 10, 1942, fourth ship in a four-ship fermation of B-36's lead by Lt. Severy G. Hadge, 0-789226 AG. The filmship fermation of B-36's lead by Lt. Severy G. Hadge, 0-789226 AG. The filmship fermation of B-36's lead by Lt. Severy G. Hadge, 0-789226 AG. The filmship fermation of the severy G. Hadge, 0-789226 AG. The filmship fermations were topped except what appeared to be very thin simple.

At appreximation three hundred (500) miles from DV-3 a cloud bank was encountered. The highest altitude I reached was fourteen thousand five hundred (14,500) feet, and I could not top the clouds. A bank was made to the laft evidently to get through a slight break. The leader increased his bank, and completed a 150° turn to the left, calling to the flight to do the same. One ship had already entered the cloud, the other evidently was unable to keep in the formation in the turn and also went sheed. These two ships were wing-ships. I was flying above and behind the leader, who began circling at 15,000 ft. and called to the flight to referm. The leader however, was all I sighted thereafter.

In an opening that was clear above and down to the curface, the leader direled and I followed until I began losing central of my ship. The first surface I lest was the clevator trin tab, which was immovable in either direction. In a short time I could get minimum rudder action with force. Then the allegan would not respond, I was forced to discontinue the circle. The last I saw the lead ship, it was an a heading of West to South-West.

Raving flows through no clouds shatever the ising of the controls was the first indication I had of ising conditions except consistent vapor trails left by the ships in frontief no. I did finally get carbureter ice, with alight loss of manifold procesure and RPN. after the centrols failed to respond. The opening below was large enough to make it possible to stay out of clouds as we descended. A maximum bank of ten (10°) degrees was all I contid make and control, and that practically with allerens alone. Indians very of practically no use shatever. As we had been through no alonds, there was no ice shatever on the wings, though there was a very thin cont on the magine coviling. Free air temperature was nime twenty (20] degrees gentigrade at 15, 000ft.

Here then thirty (30) minutes were required to descend from 13,000 ft. to 2,000 ft. a descent of more than three hundred (300) ft. per minute increased oil temperature of the left engine to one-hundred-ten (110°0.) degrees contigrade (ten degrees over operational limits). Repressing manifold pressure decreased cylinder head temperature heles operational limits. The most satisfactory power cettings were twenty-five (25) inches H 0 medifold pressure and nineteen-hundred (1900) R.P.H., with a descent of 300 ft. per minute, and frequently it was necessary to maintain level flight and increase manifold pressure to keep cylinder head temperature and oil temperature within operational limits.

When we finally reached 2,000 ft. (two thousand) engine operation became normal and I regained normal control of the ship. The last surface to break loose was the elevator trim tab.

The base of brehen clouds that we had been able to toy between 6,000 and 8,000 ft. (six and eight thousand) was at 2,000 ft. (two thousand) with showers. I tried to maintain a course to deem by dadging the abswers, but encountered a solid wall and decided to return to Bh.l.

For several minutes dadged many showers on returning, but as they

For several minutes dedged more showers on returning, but as they become more frequent, I was forced to go on instruments for some five minutes through one. Free air temperature was plus five (plus 5° 0.) degrees centigrade, visible water on the engine deviling was not freezing, and I did not find an opening large enough, with top low enough to climb back above two thousand (2000) ft. At 500 (five hundred) ft. above the surface in the snow shower, the surface was visible, with visibility estimated one half (1/2) mile. After breaking through the shower, we were able to climb in the clear, and topped broken clouds at five thousand (5000 ft.) These clouds extended to within approximately fifty to one-hundred (50 to 100) miles of the coast of Greenland.

I estimated the top of the highest cloud bank encountered during the flight to be between fifteen thousand (15,000) and sixteen (16,000) thousand feet.

> Goose Bay, Laberter, Recember 10, 1842.

The weather encountered excepts from BK-1 to Seese May was forecast as accurately as possible. I was able to top everyting on the entire flight at about eleven thousand foot indicated. I talked to Sapt. Match; forecaster at MK-1, just before I took-off and was told to head north if I encountered any weather I couldn't top. I flow most of the trip about thirty siles north of the direct route and experienced no difficulties due to weather. I flow the talked position in a three ship-flight lead by Liout. Stitu with Lt. Mawards in number two position. Liout. Hodge was not in our flight and I have no knowledge of his trip.

A TRUE COPY:

60000 Bay.

After leaving BV-1 and flying out the fjerd, we climbed to 6000 ft. We flow at this altitude for 1 kr. and a half, at which time the flight leader started to return with engine trouble. I was teld to continue on to Goose Ray at my own judgment:

In about 5 minutes I had to which to 11,000 ft. to get on top, and continued the rest of the trip on top at 11,000 ft. Upon arriving at the coast the cloude broke and it was clear the rest of the trip in.
